Correct setting without keying in mistakes.

CAMLIN[®] WinTOOL takes care of the cataloguing of NC tools, and it can do the pre-setting of equipment for the designed tool according to the catalogued settings. Then it will automatically transfer the tool measurement information to the machine tool, which prevents expensive mistakes in keying in data and consequent machine idle time.

Automatic management of work tools is of benefit to all.

It tells the designer immediately what tools are available, where they are and if they are being serviced. And this information is available over the whole of the local network, which speeds up work on the workshop side. In the identification of work tools it is possible to benefit from sequential memory and code translation buttons.

Towards integrated production.

CAMLIN[®] WinTOOL is one of the CAMLIN[®] product family, a series of Windows programs intended for increasing the efficiency of production in the metal industry. With the help of CAMLIN[®] products different stages of production from design to the production itself are under better control, which reduces mistakes, wasted time, and the possibility of breaks in production.

Improve productivity by shortening set up times.

The quicker a machine gets on with the next job, the better is profitability. When tool management cover the whole of production using CAMLIN[®] WinTOOL on a local network, you get efficient operation from your expensive machines and tools.

By means of tool store management functions the user can see rapidly which of the tools required for a particular job are in store and which may be missing.

CAMLIN[®] WinTOOL is connected directly to the measurement electronics of the presetting equipment so that the measurement data is automatically transferred to the system display.

Camline[®] products improve production efficiency.

They are software that can work individually or together to provide computer control of production, this gives increased flexibility, reduced error, and higher productivity.

CAMLIN[®] WinDIRECT

A reliable and quick tool for transferring and editing NC-programs.

CAMLIN[®] WinDNC

NC part program management from a designer's desk to a machine tool.

CAMLIN[®] WinADC

Automated data collection from production machinery, the optimisation of utilisation and availability.

CAMLIN[®] WinMAINT

Maintenance management and preventive maintenance scheduling.

CAMLIN[®] WinTOOL

Tool management with pre-setter data integration.

CAMLIN[®] WinCALIB

Calibration data management.

CAMLIN[®] WinFMS

The only IMS-level FM control system on the market.

Make it to the max. CAMLIN[®] WinTOOL.
